ALUX[®]
SafeRoller

The future of office security

The weakest parts of a building are the windows and doors. This is a fact that most burglars are well aware of and most burglaries of course happen through these weak spots. Unfortunately the previous security measures have not proven to be sufficient and we need to direct our attention more towards securing windows and doors.

There has not previously been a product on the market to meet the peoples need for security and aesthetics. This has resulted in insufficient security.

To accommodate these serious security issues we have developed the SafeRoller.

Security is the main purpose but the SafeRoller may also be useful as shading or darkening depending on the design. You can also choose to combine the SafeRoller with a traditional roller-blind and thus have more design options with the SafeRoller Combi.

The SafeRoller is a patented system tested in accordance with the European standards for security products for windows and doors. It is easy to integrate in both existing and new constructions.

Developing this solution has been a natural process since our vision is to ensure the safety and well-being for people with our Sun & Safe products.

SafeRoller®

The SafeRoller effectively protects the office against burglary. It is also designed and operated with such simplicity and elegance that it is easily integrated in all offices.

The SafeRoller works almost like traditional venetian blinds. And it is so effective that you can leave the office windows open with just the SafeRoller shut and still be properly secured.

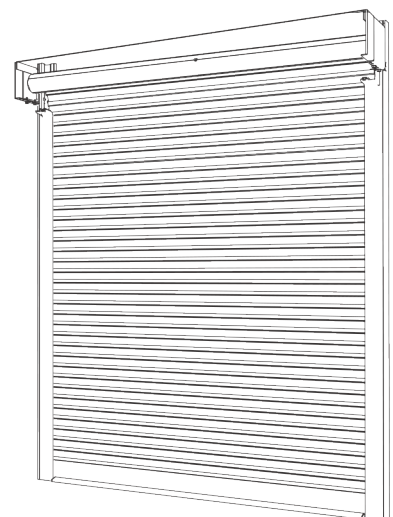

The SafeRoller comes in to versions, with perforated or non-perforated slats. The non-perforated version is ideal for darkening rooms. The perforated version lets in the daylight and gives you the possibility of air flow with a more comfortable indoor climate.

Operating the SafeRoller®

The SafeRoller is easy to operate. You can choose to do it manually or with a remote – one for each SafeRoller or one for all. Operating from a mobile device or computer is also possible.

The SafeRoller can be connected to the office alarm system. This way the SafeRoller will roll down when the alarm is set and roll up when the alarm is deactivated.

SafeRoller® Combi

SafeRoller Combi is a further development of the SafeRoller. We are combining the security part with a shading part in the form of a textile roller-blind. The two blinds are operated separately and this way you can easily roll down the roller-blind for regular shading without using the security part of the SafeRoller.

When you leave the office you simply roll down the the security part of the SafeRoller.

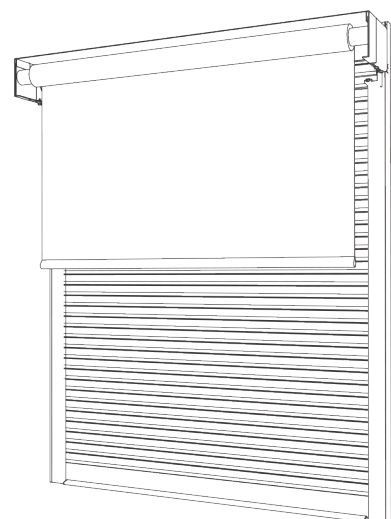

The textil roller-blind comes in many different colors, patterns and fabrics. Some with transparency, some with darkening qualities, and some in between.

All you have to do is choose the style that suits you.

Mounting the SafeRoller®

The SafeRoller is produced to fit the mounting place. This way you are getting a tailored solution fitting the specific door/window perfectly. The SafeRoller can be mounted on the window frame or on the wall. The roll can be concealed either by integrating it in the wall or by placing it in a top box.
